

Base

Create an inventory management app with Copilot for IT managers to track assets, hardware, software, and subscriptions. The app should monitor rented servers and storage, container status, subscription details, server connections, IP addresses, asset locations, and identify unassigned resources and opportunities.

It should cover:

- Virtual Machines (VMs)
- Databases and Database Servers
- Network Configurations (VLANs, VPNs)
- Security system rules and security groups.
- Backup and Recovery settings
- Cloud-based storage solutions
- Load Balancers
- API Gateways
- Monitoring and Logging tools
- Identity and Access Management (IAM)

Sure, I'd be happy to help draft an IT project plan for developing the inventory management app described in your document. Let's start by outlining the key entities, their properties, and the relationships between them. We'll also expand the scope according to the well-architected framework to ensure a comprehensive plan.

Plan prompt

Create an inventory management app with Copilot for IT managers to track assets, hardware, software, and subscriptions. The app should monitor rented servers and storage, container status, subscription details, server connections, IP addresses, asset locations, and identify unassigned resources and opportunities. This plan should provide a comprehensive overview to create the inventory management app.

Entities and Their Properties

1. Assets
 - Properties: Asset ID, Name, Type (hardware, software, subscription), IP Address, Physical Location, Status (assigned/unassigned), Provider, Price, Renewal Date, Terms, Documents.

2. Providers

- Properties: Provider ID, Name, Services Offered (servers, storage, pay-per-use), Contact Information.

3. Containers

- Properties: Container ID, Name, Application Running, Server ID.

4. Subscriptions

- Properties: Subscription ID, Name, Price, Renewal Date, Terms, Documents.

5. Servers

- Properties: Server ID, Name, Type (virtual, physical), IP Address, Location, Status, Connections (containers, software).

6. Network Configurations

- Properties: Configuration ID, Type (VLAN, VPN), Details.

7. Security Systems

- Properties: Rule ID, Security Group, Details.

8. Backup and Recovery

- Properties: Backup ID, Recovery Settings.

9. Cloud Storage

- Properties: Storage ID, Type, Capacity, Provider.

10. Load Balancers

- Properties: Load Balancer ID, Type, Configuration.

11. API Gateways

- Properties: Gateway ID, Type, Configuration.

12. Monitoring and Logging Tools

- Properties: Tool ID, Type, Configuration.

13. Identity and Access Management (IAM)

- Properties: IAM ID, User Roles, Permissions.

14. Cloud Providers

- Properties: Provider ID, Name, Services Offered (servers, storage, pay-per-use), Contact Information, Cloud Platform (AWS, Azure, Google Cloud, etc.)

15. Cross-Cloud Network Configurations

- Properties: Configuration ID, Type (VLAN, VPN), Cloud Platform, Details

Relationships Between Entities

- **Assets** are linked to **Providers** or **Cloud Providers** based on the services they offer.
- **Containers** are associated with **Servers** where they run applications.
- **Subscriptions** are linked to **Assets** for tracking renewal dates and terms.
- **Servers** have connections to **Containers** and **Software**.
- **Network Configurations** are related to **Servers** and **Assets**.
- **Security Systems** are linked to **Network Configurations** and **Servers**.
- **Backup and Recovery** settings are associated with **Servers** and **Cloud Storage**.
- **Cloud Storage** is linked to **Providers** and **Assets**.
- **Load Balancers** and **API Gateways** are connected to **Servers** and **Network Configurations**.
- **Monitoring and Logging Tools** are related to **Servers** and **Network Configurations**.
- **IAM** is linked to **Assets** and **Servers** for managing user roles and permissions.
- **Cross-Cloud Network Configurations** link two different **Cloud Providers** and provide details about the connection.
